Thermodynamic parameters;
Phase transformation.

ABSTRACT

Liquid crystalline materials find potential applications in diversified fields. Physical properties of liquid crystalline materials govern their use in different devices. A particular application demands the physical property in a particular range. In view of this the temperature variation of density and hence thermal expansion coefficient is measured on the three liquid crystalline compounds namely,
1. *(E)*-4-((hexyloxy)benzylidene)amino)phenyl 4-butoxy benzoate (S-1)
2. *(E)*-4-((hexyloxy)benzylidene)amino)phenyl 4-(decycloxy benzoate) (S-2) and
3. *(E)*-4-((hexyloxy)benzylidene)amino)phenyl 4-(tridecycloxy benzoate) (S-3)
Using the thermal expansion coefficient, the number of thermo dynamical parameters was evaluated. The results revealed that all the thermo dynamic parameters show the characteristic changes at the phase transformation.

INTRODUCTION

The liquid crystalline research is a part of material work which consists of design, synthesis and characterization of new materials and further to test their suitability in applications by measuring different physical parameters like viscosity, electrical and magnetic susceptibilities, optical properties and thermo dynamical properties. The thermodynamic parameters provide the necessary input to understand different kinds of interactions involved in the molecular formation. In the present study the temperature variation of density is measured as described in the literature (Ajeetha *et al.,* 2006; Ranga Reddy *et al.,* 1999; Rao *et al.,* 1991; Gogoi *et al.,* 2002; Gogoi *et al.,* 2005; Datta Prasad *et al.,* 2009; Sivaram *et al.,* 1999). Using the density data, thermal expansion coefficient and various thermo dynamical parameters viz., Moelwyn-Hughes parameter (C_1), the reduced molar volume ($\tilde{V}$), the isochoric temperature coefficient of internal pressure (X), the Sharma's parameter(S_0), fractional free volume (f), Thermal parameter (A^*), Gruneisen parameter (Γ_p), the reduced bulk modulus (β^-), isothermal, isochoric and isobaric Gruneisen parameter (Γ_{ith}, Γ_{ich}, Γ_{iba}), Beyer's nonlinearity parameter (B/A), isochoric temperature coefficient of volume expansivity (X^I), Pressure coefficient of bulk modulus (C_1^*) have been evaluated for the benzylidene amino phenyl benzoate liquid crystalline compounds with side chain n=6 and end chains m=4,10 and 13. The molecular structure of the compounds is shown in Figure 1. The results are discussed with the light of the literature data available on number of liquid crystalline compounds.

Experimental

The density of the LC compounds is measured by using dilatometer, which consists of specially constructed Pyknometer. The Pyknometer consists of capillaries with a diameter of about 250 microns and 0.07-0.12 m length is mounted on a U-shaped glass tube. The Pyknometer was calibrated by measuring the molar volume of water at different temperatures. The sample is filled in pyknometer and its mass was measured by using chemical balance with an accuracy of 0.0001×10^{-3} Kg. The pyknometer was kept in heating chamber at a temperature 10^{o}C above the clearing temperature. Then the sample was slowly cooled until the sample level reaches the mark in capillaries. The excess sample in the cups of the capillaries was removed by syringe.

Conventional cathetometer was used to measure the liquid crystal levels in the capillaries. The main scale and verneir scale is replaced with a digital scale instead of viewing the liquid levels through the telescope eyepiece, a charge-coupled device camera is attached to the telescope and the levels of capillary were observed on a monitor with a very high magnification. The detailed experimental setup is shown in Figure 2.

Theory and Expressions

The theory for the estimation of different thermodynamic parameters using the coefficient of thermal expansion (α) are reported by several authors (Ranga Reddy *et al.,* 1999; Reddy *et al.,* 2007; Fakruddin *et al.,* 2010) and the relevant expressions are given below. The Moelwyn-Hughes parameter (Moelwyn-Hughes, 1951) and the reduced molar volume ($\tilde{V}$) are evaluated from the following expressions.

$$C = \frac{13}{3} + (\alpha T)^{-1} + \frac{4}{3}(\alpha T) \quad (1)$$

$$\tilde{V} = \left[1 + \frac{\alpha T}{3(1+\alpha T)}\right]^3 \quad (2)$$

Using the coefficient of thermal expansion Haward and Parker (Haward and Parker, 1968) obtained an expression for the isochoric temperature coefficient of internal pressure (X) as

$$X = \frac{-2(1+2\Gamma)}{V^{C_1}} \quad (3)$$

The isochoric temperature coefficient of volume expansivity (X^1) can be given as

$$X^1 = -(1 + 2\alpha T) \quad (4)$$

The Sharma parameter (Sharma, 1983; Reddy *et al.,* 2007) (S_o) is given by the expression

$$S_o = \frac{-X}{2}(3 + 4\alpha T) \quad (5)$$

The fractional free volume (f) is a measure of disorder due to increasing mobility of molecules in a polymer and can be expressed in terms of the isothermal microscopic Gruneisen parameter (Γ) as

$$f = \left(\frac{V_a}{V}\right) = \left(\frac{1}{\Gamma+1}\right) \quad (6)$$

Where V_a is the available volume of a liquid crystal.

Thermal parameter (A^*), is a dimensionless parameter which shows that at low temperatures, a liquid crystal tends to be ordered exhibiting a small thermal expansion and small fractional free volume, thereby making A^* equal to unity.

$$A^* = \left(\frac{1+f^*}{1-f}\right) = 1 + \left(\frac{f}{\Gamma}\right) \quad (7)$$

The Gruneisen parameter (Γ_p) for liquid crystals can be found from

$$\Gamma_p = \left(\frac{2}{3}\right)\alpha T + \left(\frac{1}{2\alpha T}\right) + 2 \quad (8)$$

The isothermal, isobaric and isochoric Gruneisen parameters are identical to the corresponding acoustical parameters so one can write

$$\Gamma_{ich} = \Gamma_{ith} + \Gamma_{iba} \quad (9)$$

The isochoric Gruneisen parameter Γ_{ich} could be evaluated using the following equation

$$\Gamma_{ich} = -\frac{E-F}{F} \quad (10)$$

Where $E = -[2 + (\alpha T)^{-1}]\left[2\alpha\left(\tilde{V}\right)^{C1-1}\right]$ and F=-2α

The isothermal Anderson-Gruneisen parameter (δ) is known to be an important parameter in the theory of temperature dependence of bulk modulus in solids. It is defined as

$$\delta = 2\Gamma_{iba} \quad (11)$$

The Anderson-Gruneisen parameter is distinguished from the Moelwyn-Hughes parameter by introducing a new parameter θ as

$$\theta = 2(\Gamma_{ith} - \Gamma_{iba}) + 1 \quad (12)$$

The pressure coefficient of bulk modulus C_1^* as derived from α and V is given as

$$C_1^* = \left(1 + \frac{\delta}{3}\right)\left[1 + (1 + \frac{1}{\alpha T})/(1 + \frac{\delta}{3})\right] \quad (13)$$

RESULTS AND DISCUSSION

The temperature variation of density for the liquid crystalline compounds is measured and illustrated in Figures 3, 4 and 5. The density is found to decrease with increase of temperature and density jumps observed at phase transformations. The thermal expansion coefficient (α) and various thermo dynamic parameters were estimated and represented in Tables 1, 2 and 3. The temperature variation of Moelwyn-Hughes parameter (C_1), Reduced bulk modulus (β^-), Reduced molar volume ($\tilde{V}$) of the liquid crystalline compounds are shown in Figures 6-9. The Sharma parameter (S_o) is found to be constant in all the three compounds and it is around 1.118 ±0.001. The parameters C_1, Γ_p, β^-, δ, B/A slightly decreases with increase of temperature and in the vicinity of the phase transformation there is abrupt decrease in the above values. Reduced molar volume ($\tilde{V}$), isochoric temperature coefficient of internal pressure (X), fractional free volume (f) is found to be increase with the increase of temperature and during phase transformation there is a sudden increase in the above values. The thermal parameter (A^*) is found to be unity. According to literature (Reddy *et al.,* 2007) also the value is unity for all the liquid crystalline compounds. The Beyer's nonlinearity parameter (B/A) lies in the range 11-12.

In the vicinity of phase transformation there is a sudden change in this value and which is found to be 6-7. The isothermal, isochoric and isobaric Gruneisen parameters (Γ_{ith}, Γ_{ich}, Γ_{iba}) have consistent values in liquid crystalline phase but there is steep decrease in these values at phase transformations.

Conclusions: All the thermo dynamical parameters evaluated have almost constant values in a particular phase and in the vicinity of phase transformation there are abrupt changes. At phase transformation, the value of Moelwyn-Hughes parameter and Beyer's nonlinearity parameter reduces suddenly by 5.2-5.8 in three liquid crystalline compounds. The reduced molar volume increases by 0.24-0.26, whereas the Sharma parameter and the thermal parameter are found to be constant irrespective of phase transitions.

Acknowledgment: Authors express their thanks to the Department of Physics, S. K. University, Anantapur, for providing laboratory facilities. The authors are thankful to T.N. Swamy, Senior Scientist, CLRI, Chennai for providing liquid crystalline compounds to carry out physical properties. The financial support rendered by the UGC New Delhi under SAP [No.F.530/8/DRS/2010 (SAP-I)]; Department of Science and Technology under FIST [SR/FST/PSI-116/2007] and VTU Belgaum under VTU research grant scheme for the research project [No. VTU/Aca/2011-12/A-9/750] are gratefully acknowledged. One of the author C.M. Subhan is thankful to UGC New Delhi for providing BSR fellowship.
